DIRECT MEDICATION The Most Important Medical Achievement of the 20th Century. For the past fifty years medical scientists have worked steadily with the view of devising a method of direct medication, that is, a method by which medicinal substances could be administered directly into the blood, the part or organ diseased. First came the hypodermic syringe and the administration of curative agents under the skin or directly into the diseased organs. Some ten years ago the admin-Istration of saline solutions directly into the blood stream was advocated and practiced. Since this time medical science has gradually progressed until at the present time the direct method of medication has been perfected and has about taken the place of the old quackish way of treating many of the vital diseases. And why not?
